Non-split domination number.

ABSTRACT

In graph theory, a connected component of an undirected graph is a sub graph in which any two vertices are connected to each other by paths. For a graph  $G$ , if the sub graph of  $G$  itself is a connected component then the graph is called connected, else the graph  $G$  is called disconnected and each connected component sub graph is called its components. Circular-arc graphs have variety of applications involving traffic light sequencing, genetics etc. A dominating set  $D$  of graph  $G = (V, E)$  is a non-split dominating set if the induced sub graph  $\langle V-D \rangle$  is connected. The non-split domination number  $\gamma_{ns}(G)$  of  $G$  is the minimum cardinality of a non-split dominating set. In this paper constructed an algorithm for finding a non-split dominating set of an Circular-Arc graph. Also its relationships with other parameters is investigated.

INTRODUCTION

Consider  $A = \{ A_1, A_2, \dots, A_n \}$  a family of arcs on a circle  $C$ . Each endpoint of the arc  $A_i$  is assigned a positive integer called a co-ordinate. The endpoints are located at the circumference of  $C$  in ascending order of the values of the co-ordinates in the clockwise direction. Suppose that an arc begins at  $c$  and ends at point  $d$  in the clockwise direction. Then we denote such an arc by  $[c, d]$  and the points  $c$  and  $d$  arc called respectively the head point and tail point of the arc. The arcs are given labels in the increasing order of their head points. If the head point of an arc is less than the tail point of the arc then the arc is called a forward arc. Otherwise it is called a backward arc.  $A$  is called a proper arc family if no arc in  $A$  contains another arc. A graph  $G=(V, E)$  is called a circular-arc graph if there is a one - to - one correspondence between  $V$  and  $A$  such that two vertices in  $V$  are adjacent if and only if their corresponding arcs in  $A$  intersect. Let us now denote the arc family by  $A = \{ 1, 2, \dots, n \}$ , where arc  $i=A_i$  and  $G$  is its corresponding Circular-arc graph. We assume that  $G$  is a connected graph. Circular-arc graphs have been studied in [1][2]. Let  $G = (V, E)$  be a graph. A set  $D \subseteq V$  is a dominating set [3] of  $G$  if every vertex in  $\langle V-D \rangle$  is adjacent to some vertex in  $D$ . The domination number  $\gamma(G)$  of  $G$  is the minimum cardinality of a dominating set. A dominating set  $D$  is connected dominating set if the induced sub graph  $\langle D \rangle$  is connected. The connected domination number [4]  $\gamma_c(G)$  of  $G$  is the minimum cardinality of a connected dominating set. A dominating set  $D$  of a graph  $G = (V, E)$  is a split dominating set if the induced sub graph  $\langle V-D \rangle$  is disconnected. The split

domination number [5]  $\gamma_s(G)$  of  $G$  is the minimum cardinality of a split dominating set. The purpose of this paper is to introduce the concept of constructed an algorithm for finding a non- split dominating set of circular-arc graph. A dominating set  $D$  of a graph  $G=(V, E)$  is a non-split dominating set, if the induced sub graph  $\langle V-D \rangle$  is connected. The non-split domination number  $\gamma_{ns}(G)$  of  $G$  is the minimum cardinality of a non-split dominating set. Kulli .V.R et.all [6] introduced the concept of split and non split domination in graphs and also in Maheswari, *et al.* [7]. The neighbourhood of a vertex  $v \in V$  is set consisting all vertices adjacent to  $v$  (including  $v$ ). It is denoted by  $nbd[v]$ . Let  $nbd[i]$  be defined as the set of vertices adjacent to  $i$  including  $i$ . A subset  $S$  of  $V$  in  $G$  is called a neighbourhood set of  $G$  if  $G = \bigcup_{v \in S} nbd[v]$ , where  $\langle nbd[v] \rangle$  is the vertex induced subgraph of  $G$ . The neighbourhood number of  $G$  is defined as the minimum cardinality of a neighbourhood set of  $G$ . In addition, if the set  $S$  is independent then  $S$  is called an independent neighbourhood set of  $G$ . Let  $\max(i)$  denotes the largest interval in  $nbd[i]$ . Gruprakash. C. D., Mallikarjuna Swamy.B. P [8], Minimum Matching dominating sets and its applications in wireless networks define  $\text{Next}(i) = j$  if and only if  $b_i < a_j$  and there does not exist an interval  $k$  such that  $b_i < a_k < a_j$ . If there is no such  $j$ , we define  $\text{Next}(i) = \text{null}$ , this means that we should not have consider in terms of  $\text{next}(i)$ . But we should have been considering in neighbourhood sets.

**Verification of an algorithm for finding a non-split dominating set**

Input: Circular-arc family  $A = \{ A_1, A_2, \dots, A_n \}$ .

Output: Non-split dominating set and induced sub graph is connected.

Step1:  $V = \{v_1, v_2, \dots, v_n\}$ ,  $T = \{j/j \in \text{nbd}[1] \text{ and forward arc } \}$ ,

$P = \{j/j \in T \text{ and } j \in \text{nbd}[k] \forall k \text{ in } T\}$

Step2:  $S =$  The least largest degree interval in  $P$

Step3 :  $LI =$  The largest interval in  $S$

Step4: Compute Next ( $LI$ ). If  $\text{Next}(LI) \in \text{nbd}[\min(S)]$  then go to step 8

Step5: If  $\text{Max}(\text{Next}(LI)) \in \text{nbd}[r], \forall r \in S$

Step6:  $\text{Max}(\text{Next}(LI)) = \{\text{Max}(\text{Next}(LI))\} - \{1\}$  go to step 5  
Else go to next step

Step7:  $S = S \cup \text{Max}(\text{Next}(LI))$  go to step 3

Step8:  $V - S = \{s_1, s_2, \dots, s_{n-Y}\}$ , where  $Y = |S|$

Step9: for  $i = 1$  to  $n - Y - 1$

```

    {
        for  $j = i + 1$  to  $n - Y$ 
        {
            If  $(s_i, s_j) \in E(G)$ , then join from  $s_i$  to  $s_j$ 
        }
    }
    } The induced graph  $G_1$  is obtained
    
```

Step10: If  $w(G_1) = 1$  (Here  $w(G_1)$  indicates number of components)

Therefore the graph  $G_1$  is connected.

Hence  $S$  is non-split dominating set.

Else

$S$  is split dominating set

Step11: End.

**Main Theorems**

**Theorem1:** Let  $A = \{A_1, A_2, \dots, A_n\}$  be a circular-arc family and  $G$  is circular-arc graph corresponding to  $A$ . If  $A_i$  and  $A_j$  are any two arcs in  $A$  such that  $A_j$  is contained in  $A_i$  and  $A_i \in D$  and if  $A_i$  is any arc in  $A$  which is to the left of  $A_j$  in clock wise direction such that  $A_i < A_j$  and  $A_i$  intersect  $A_j$  and if there is at least one  $A_k > A_j$  such that  $A_k$  intersects  $A_j$  then non-split domination occurs in  $G$ .

**Proof:** Let  $A = \{A_1, A_2, \dots, A_n\}$  be a circular-arc family and  $G$  be circular-arc graph corresponding to  $A$ . If  $A_i$  and  $A_j$  are any two arcs in  $A$  such the  $A_j$  is contained in  $A_i$  and  $A_i \in D$ . Suppose there is at least one arc  $A_k \neq A_i, A_k > A_j$  such that  $A_k$  intersect  $A_j$  then it is obvious that in the induced sub graph  $\langle V - D \rangle, A_k$  is adjacent to  $A_j$ . By hypothesis there is at least one  $A_m < A_j$  in  $\langle V - D \rangle$  such that  $A_m$  intersects  $A_j$ . Hence  $A_j$  is connected to it's left as well as to it's right. So that there will not be disconnection in the induced sub graph  $\langle V - D \rangle$ . This proves directly. Further find the non-split dominating set apart from an algorithm by using neighbourhood system of a circular-arc graph  $G$  corresponding to circular-arc family. The procedure as follows with an illustration.

**Illustration**

We can draw a circular-arc graph from a circular-arc family .

$\text{nbd}[1] = \{1, 2, 3, 10, 11\}$ ,

$\text{nbd}[2] = \{1, 2, 3, 4\}$ ,

$\text{nbd}[3] = \{1, 2, 3, 4, 5\}$ ,

$\text{nbd}[4] = \{2, 3, 4, 5, 6\}$ ,

$\text{nbd}[5] = \{3, 4, 5, 6, 7\}$ ,

$\text{nbd}[6] = \{4, 5, 6, 7\}$ ,

$\text{nbd}[7] = \{5, 6, 7, 8, 9\}$ ,

$\text{nbd}[8] = \{7, 8, 9, 10, 11\}$ ,

$\text{nbd}[9] = \{7, 8, 9, 10\}$ ,

$\text{nbd}[10] = \{1, 8, 9, 10, 11\}$ ,

$\text{nbd}[11] = \{1, 8, 10, 11\}$

**Figure 1. Circular-arc family**

$\text{Max}(1) = 11, \text{Max}(2) = 4, \text{Max}(3) = 5, \text{Max}(4) = 6,$

$\text{Max}(5) = 7, \text{Max}(6) = 7, \text{Max}(7) = 9, \text{Max}(8) = 11, \text{Max}(9) = 10,$

$\text{Max}(10) = 11, \text{Max}(11) = 11.$

$\text{Next}(1) = 4, \text{Next}(2) = 5, \text{Next}(3) = 6, \text{Next}(4) = 7, \text{Next}(5) = 8,$

$\text{Next}(6) = 8, \text{Next}(7) = 10, \text{Next}(8) = \text{null}, \text{Next}(9) = \text{null},$

$\text{Next}(10) = \text{null}, \text{Next}(11) = \text{null}$

**Procedure**

Input: Circular-arc family  $A = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11\}$

Step1:  $V = \{1, 2, \dots, 11\}$ ,  $T = \{1, 2, 3\}$ ,  $P = \{1, 2, 3\}$

Step2:  $S = 1$

Step3:  $LI = 1$

Step4:  $\text{Next}(1) = 4$

Step5 :  $\text{Max}(4) = 6$

Step6:  $S = \{1\} \cup \{6\} = \{1, 6\}$  go to Step3

Step7:  $LI = 6$

Step8:  $\text{Next}(6) = 8$

Step9=  $\text{Max}(8) = 11 - 1 = 10 - 1 = 9$  go to step3

Step10:  $S = \{1, 6, 9\}$

Step11:  $V - S = \{2, 3, 4, 5, 7, 8, 10, 11\}$

Step12: for  $i = 1, j = 2, (s_1, s_2) = (2, 3) \in E(G)$ , join from 2 to 3

$j = 3, (s_1, s_3) = (2, 4) \in E(G)$ , join from 2 to 4

for  $i = 2, j = 3, (s_2, s_3) = (3, 4) \in E(G)$ , join from 3 to 4

$j = 4, (s_2, s_4) = (3, 5) \in E(G)$ , join from 3 to 5

for  $i = 3, j = 4, (s_3, s_4) = (4, 5) \in E(G)$ , join from 4 to 5

for  $i = 4, j = 5, (s_4, s_5) = (5, 7) \in E(G)$ , join from 5 to 7

for  $i = 5, j = 6, (s_5, s_6) = (7, 8) \in E(G)$ , join from 7 to 8

for  $i = 6, j = 7, (s_6, s_7) = (8, 10) \in E(G)$ , join from 8 to 10

$j = 8, (s_6, s_8) = (8, 11) \in E(G)$ , join from 8 to 11

for  $i = 7, j = 8, (s_7, s_8) = (10, 11) \in E(G)$ , join from 10 to 11

The induced subgraph  $G_1$  is obtained

Step13:  $w(G_1) = 1$

Therefore the graph  $G_1$  is connected.

Hence  $S = \{1, 6, 9\}$  is a non-split dominating set.

Step 14: End

Output:  $S = \{1, 6, 9\}$  is a non-split dominating set and  $G_1$  is connected.

**Theorem2:** Let A be a circular-arc family and G be a circular-arc graph corresponding to A. If  $A_j = 2$  is the arc contained in  $A_i = 1$  and  $A_j \in D$ , where D is a dominating set and there is at least one arc that intersects  $A_j$  it's right other than  $A_i$  then non-split domination occurs in G.

**Proof:** Let A be circular-arc family and G is a circular-arc graph corresponding to A. If  $A_j = 2$  is the arc contained in  $A_i = 1$  and  $A_i \in D$ , where D is a dominating set. Suppose  $A_k$  is any arc  $A_k \neq A_i, A_k > A_j$  such that  $A_k$  intersects  $A_j$ . Then in the induced sub graph  $\langle V - D \rangle$ ,  $A_j$  is connected to  $A_k$ , so that there is no disconnection for  $A_j$  to it's right in clockwise direction. After that we prove that the above procedure towards as algorithm and we will verify as the following.

**Illustration**

We can draw a circular-arc graph from a circular-arc family  
 $nbdf[1]=\{1,2,3,4,10\}, nbdf[2]=\{1,2,3\}, nbdf[3]=\{1,2,3,4\},$   
 $nbdf[4]=\{1,3,4,5\}, nbdf[5]=\{4,5,6,7\}, nbdf[6]=\{5,6,7,8\},$   
 $nbdf[7]=\{5,6,7,8,9\}, nbdf[8]=\{6,7,8,9,10\},$   
 $nbdf[9]=\{7,8,9,10\}, nbdf[10]=\{1,8,9,10\}$   
 $Max(1)=10, Max(2)=3, Max(3)=4, Max(4)=5, Max(5)=7, Max(6)=$   
 $8, Max(7)=9, Max(8)=10, Max(9)=10, Max(10)=10$   
 $Next(1)=5, Next(2)=4, Next(3)=5, Next(4)=6, Next(5)=8,$   
 $Next(6)=9, Next(7)=10, Next(8)=null, Next(9)=null,$   
 $Next(10)= null$

Figure 2. Circular-arc family

**Procedure**

Input: Circular-arc family  $A=\{1,2,3,4,5,6,7,8,9,10\}$   
 Step1:  $V = \{1,2,\dots,10\}, T = \{1,2,3,4\}, P = \{1,3\}$   
 Step2:  $S = 1$   
 Step3:  $LI = 1$   
 Step4:  $Next(1) = 5$   
 Step5 :  $Max(5) = 7$   
 Step6:  $S=1 \cup 7 = \{1,7\}$  go to Step3  
 Step7:  $LI = 7$   
 Step8:  $Next(7)=10$   
 Step9=  $Max(10)=10-1=9-1=8-1=7$   
 Step10:  $S=\{1,7\}$   
 Step11:  $V-S=\{2,3,4,5,6,8,9,10\}$   
 Step12: for  $i=1, j = 2, (s_1, s_2) = (2,3) \in E(G)$ , join from 2 to 3  
 for  $i=2, j = 3, (s_2, s_3) = (3,4) \in E(G)$ , join from 3 to 4  
 for  $i=3, j = 4, (s_3, s_4) = (4,5) \in E(G)$ , join from 4 to 5  
 for  $i=4, j = 5, (s_4, s_5) = (5,6) \in E(G)$ , join from 5 to 6  
 for  $i=5, j = 6, (s_5, s_6) = (6,8) \in E(G)$ , join from 6 to 8  
 for  $i=6, j = 7, (s_6, s_7) = (8,9) \in E(G)$ , join from 8 to 9

$j = 8, (s_6, s_8) = (8,10) \in E(G)$ , join from 8 to 10  
 for  $i=7, j = 8, (s_7, s_8) = (9,10) \in E(G)$ , join from 9 to 10  
 The induced subgraph  $G_1$  is obtained  
 Step13:  $w(G_1)=1$   
 Therefore the graph  $G_1$  is connected.  
 Hence  $S=\{1,7\}$  is a non-split dominating set.  
 Step14: End  
 Output:  $S=\{1,7\}$  is a non-split dominating set and  $G_1$  is connected.

**Theorem3:** Let A be circular-arc family and G be a circular-arc graph corresponding to A. If  $A_i, A_j, A_k$  are three consecutive forward arcs in A where A is a proper arc family such that  $A_i < A_j < A_k, A_j \neq 1$  and  $A_i$  and  $A_j$  intersect,  $A_j$  and  $A_k$  intersect but  $A_i$  and  $A_k$  do not intersect and  $A_j \in D$  and there is atleast one backward arc in  $\langle V-D \rangle$  then non-split domination occurs in G.

**Proof:** Let A be circular-arc family and G be a circular-arc graph corresponding to A. If  $A_i, A_j, A_k$  are three consecutive forward arcs in A where A is a proper arc family such that  $A_i < A_j < A_k, A_j \neq 1$  and  $A_i$  and  $A_j$  intersect,  $A_j$  and  $A_k$  intersect but  $A_i$  and  $A_k$  do not intersect and  $A_j \in D$  and there is atleast one backward arc in  $\langle V-D \rangle$ . Since  $A_j \in D, A_i$  and  $A_k$  are disconnected in clockwise direction in  $\langle V-D \rangle$ . However if there is a backward arc in  $\langle V - D \rangle$  then there is a path between  $A_k$  and  $A_i$  in clockwise direction namely  $(A_k, A_i)$ -path, so that  $A_j$  and  $A_k$  are connected in  $\langle V-D \rangle$ . Hence there is no disconnection in  $\langle V-D \rangle$ . The above procedure can verify using a method of algorithms.

**Illustration**

We can draw a circular-arc graph from a circular-arc family  
 $nbdf[1]=\{1,2,3,10\}, nbdf[2]=\{1,2,3,10\},$   
 $nbdf[3]=\{1,2,3,4\}, nbdf[4]=\{3,4,5,6\}, nbdf[5]=\{4,5,6,7\},$   
 $nbdf[6]=\{4,5,6,7,8\}, nbdf[7]=\{5,6,7,8,9\}, nbdf[8]=\{6,7,8,9,10\},$   
 $nbdf[9]=\{7,8,9,10\}, nbdf[10]=\{1,2,8,9,10\}$   
 $Max(1) =10, Max(2)=10, Max(3)=4, Max(4)=6, Max(5)=7,$   
 $Max(6)=8, Max(7)=9, Max(8)=10, Max(9)=10, Max(10)=10$   
 $Next(2)=4, Next(3)=5, Next(4)=7, Next(5)=8, Next(1)=4,$   
 $Next(6)=9, Next(7)=10, Next(8)=null, Next(9)= null,$   
 $Next(10)= null$

Figure 3. Circular-arc family

**Procedure**

Input: Circular-arc family  $A=\{1,2,3,4,5,6,7,8,9,10\}$   
 Step1:  $V = \{1,2,\dots,10\}, T = \{1,2,3\}, P = \{1,2,3\}$   
 Step2:  $S = 1$   
 Step3:  $LI = 1$   
 Step4:  $Next(1) = 4$

Step5 :  $\text{Max}(4) = 6$   
 Step6:  $S = \{1\} \cup \{6\} = \{1,6\}$  go to Step3  
 Step7:  $LI = 6$   
 Step8:  $\text{Next}(6) = 9$   
 Step9:  $\text{Max}(9) = 10 - 1 = 9$   
 Step10:  $S = \{1,6,9\}$  go to step 3  
 Step11:  $V - S = \{2,3,4,5,7,8,10\}$   
 Step12: for  $i=1, j=2, (s_1, s_2) = (2,3) \in E(G)$ , join from 2 to 3  
            $j=7, (s_1, s_7) = (2,10) \in E(G)$ , join from 2 to 10  
 for  $i=2, j=3, (s_2, s_3) = (3,4) \in E(G)$ , join from 3 to 4  
 for  $i=3, j=4, (s_3, s_4) = (4,5) \in E(G)$ , join from 4 to 5  
 for  $i=4, j=5, (s_4, s_5) = (5,7) \in E(G)$ , join from 5 to 7  
 for  $i=5, j=6, (s_5, s_6) = (7,8) \in E(G)$ , join from 7 to 8  
 for  $i=6, j=7, (s_6, s_7) = (8,10) \in E(G)$ , join from 8 to 10  
            $j=8, (s_6, s_8) = (8,10) \in E(G)$ , join from 8 to 10  
 for  $i=7, j=8, (s_7, s_8) = (9,10) \in E(G)$ , join from 9 to 10

The induced subgraph  $G_1$  is obtained

Step13:  $w(G_1) = 1$

Therefore the graph  $G_1$  is connected.

Hence  $S = \{1,6,9\}$  is a non-split dominating set.

Step14: End

Output:  $S = \{1,6,9\}$  is a non-split dominating set and  $G_1$  is connected
